Bohdan Leniuk

University of Georgia
Amos Hall B458F
Email: bohdan.leniuk@uga.edu

Education

University of Georgia — Athens, GA
PhD in Economics — 2022–Present
Primary advisor: Martin Gervais

University of Georgia — Athens, GA
MA in Economics — 2022-2023

University of Georgia — Athens, GA
BBA in Economics, Minor in Statistics — 2019-2022

Professional Experience

Data Scientist, State Farm (MAGNet Program) — Athens, GA
2021

Research Interests

Macroeconomics; Labor Economics

Research & Teaching Experience

Graduate Research Assistant, University of Georgia

- Bill Lastrapes — 2023
- Svetlana Pashchenko — 2024
- Martin Gervais — 2025-Present

Teaching Assistant, University of Georgia

- Intermediate Macroeconomics — 2022-Present
- Microeconomic Theory I (PhD) — Fall 2024
- Microeconomic Theory II (PhD) — Spring 2024, Spring 2025
- Time Series Analysis (MS) — 2022-2023

Instructor of Record, University of Georgia

- Principles of Macroeconomics — 2025

Honors & Awards

Scholarships:

- Edward T. Comer Scholarship, University of Georgia — 2023-2025
- Bonbright Center for the Study of Regulation, University of Georgia — 2022
- Zell B. Miller Scholarship — 2019-2022

Awards & Recognitions:

- Rookie of the Year, Vienna Macro Workshop 2026
- Best Second-Year Paper, University of Georgia 2024
- Deans List, University of Georgia 2019-2022
- AP Scholar with Distinction 2019

Technical Skills

R , Python, MATLAB, Stata

Working Papers

1. "Promotions, Unemployment, and Labor-Market Sorting Under Asymmetric Information,"

   This paper studies how promotions and unemployment shape labor-market sorting and wages. Using the 1979 National Longitudinal Survey of Youth (NLSY79), I show that promotions amplify the wage losses associated with unemployment spells: previously promoted workers experience larger wage losses upon re-employment, and those losses increase as the spell prolongs, even conditional on pre-displacement wage and tenure. I interpret these facts through a structural model of promotions and job search in which firms learn about worker ability from a worker's history of promotions and unemployment spells. When hiring a worker out of unemployment, firms use this information to assign him a position. Because unemployment duration is a noisy signal of ability, the model implies that unemployment can serve as a shock to labor-market sorting through which firms may either correct an erroneous promotion or incorrectly move capable workers back down the job-ladder. Because UI benefits alter search behavior, they also change how much an unemployment spell reveals about a worker. Relative to a flat benefit profile, UI plans that tie benefits to past wages worsen sorting and lower aggregate output, while policies that target benefits toward low-ability workers improve sorting and raise output.

Work in Progress

1. "Pension Plan Design and Worker Mobility: Evidence from LEHD, Form 5500, and Summary Plan Descriptions" with Martin Gervais.

Conference Presentations

2026: I-85 Macro Workshop, Columbia, SC; Vienna Macro Workshop, Vienna, Austria; Midwest Macro Meetings, Lubbock, TX; Southern Economic Association Meetings, Houston, TX
